1. The Safety Hub

Safety is reached from Home › DrillTick Safety. It is a menu of areas, each shown as a tile with its own colour.

Tile	Opens	Status
Personal Safety	A placeholder for personal safety modules	Coming soon
Process Safety	Permit to Work, Risk Assessment Report, HAZOP Report, Well Control and Lifting Operations	Partly built
Report An Event	Choose Observation, Near Miss or Incident	Built
Safety Dashboard	The charts and event register described below	Built
HSE Periodic Reporting	Daily, Weekly and Monthly reports. Only the Monthly report is built	Partly built
Checklists	Seven safety and operational checklists	Built

Inside Process Safety, **Permit to Work**, **Well Control** and **Lifting Operations** (Rigging and Slings, Crane Lifting Plan, Lifting Manual) are built; **Risk Assessment Report** and **HAZOP Report** show “coming soon”.

2. The Safety Dashboard

A full-screen performance dashboard titled “HSE Performance & KPI Overview”. It reads the reports that people have submitted through Report An Event, so the charts always reflect the latest records. A scrolling strip of tabs along the top switches between seven pages.

State is kept

All seven pages stay alive while you move between tabs, so date ranges and filters are still there when you come back. When a new report is submitted, the dashboard reloads its data by itself.

3. The Seven Pages

Tab	What it shows
Overview	Four KPI cards (LTI , MTC , Near Miss , Observations) above a unified event register : one table of every observation, near miss and incident
Observations	Charts for safe, unsafe-act and unsafe-condition observations
Near Miss	Charts for near-miss reports by category, department, risk level and status
Incidents	Charts for incidents, broken into LTI, MTC, FAC and first aid
HPI & RAM 4+	High Potential Incidents and events with a risk-matrix score of 4 or more. KPI row, trend chart, risk-score bars, root-cause analysis, a department heat-map and a Heinrich triangle
Personal Safety	Incidents that affect people, plus their near-miss precursors. Purple accent. Total, open and high-risk tiles, a risk strip, a status pipeline, a monthly near-miss bar and category-group bars
Process Safety	The same layout for incidents that affect assets, the environment or the community. Blue accent

4. The Event Register

The Overview page ends with a table that behaves like a small spreadsheet.

- **Column filters.** Tap a column header to open a checklist of its values. Filters cascade like Excel: each list shows only the values that remain after the other filters are applied.
- **A date tree.** The date filter groups values by year and month, with tick boxes that tick fully, partly or not at all, just like a file explorer. The most recent year opens by default.
- **Colour and stripes.** Rows alternate in shade, and values such as risk level and status take their meaning colours.
- **Open a record.** Tapping a row opens the matching report form, in view or edit mode, depending on its type.
- **Delete.** Removing a record asks for confirmation first, then refreshes every tab.
- **Export.** One button writes the filtered rows to a CSV file and shares it. If no rows match, a short message appears instead.

5. Drilling Down from Charts

Tap a chart segment and then **See Data**, and the dashboard jumps to the Overview page with the table already filtered to those records. The Observations, Near Miss and Incidents pages work this way. The HPI & RAM page uses its own model and does not drill through.

Each detail page lets you change how the trend is grouped: **day by day, month by month or year by year**. Tapping the active choice again falls back to month by month. Date-range pickers open directly under the field.

6. How Records Are Unified

Observations, near misses and incidents are stored separately, but the dashboard converts each into one common shape: date, department, category, risk level, status and type. That shared shape lets one table and one set of filters cover everything.

- A custom description typed by the user is preferred over the drop-down category.
- Incidents are never low risk by definition, so they appear as Medium or High.
- Incident severity and consequence decide the sub-type: LTI, MTC, FAC or first aid.
- Records are sorted newest first.
