

Incident Report

Recording an event where harm occurred, from first details to root cause

HPI check

CAPA tables

RCA

1. What It Is

The Incident Report form records an event in which **injury, illness, damage or pollution actually occurred**. It is the most detailed of the reporting forms and follows the shared stepper pattern described in the Report An Event guide. Submitted incidents are kept permanently and feed the Safety Dashboard.

2. Section by Section

Section 1 — Reporting Details

Location or area, department, who reported it (or **Anonymous**), the date and the time.

Section 2 — Incident Type

One category from a grouped list:

Group	Examples
Physical hazards	Slip / trip, dropped object, struck by or against, caught in or between, fall from height
Mechanical & equipment	Moving machinery incident, equipment malfunction, tool failure, LOTO failure
Electrical	Electric shock, arc flash, electrical fault
Chemical / gas	Gas leak, hazardous material release
Fire & explosion	Fire incident, explosion, flash fire
Vehicle & traffic	Vehicle collision, vehicle rollover, pedestrian hit
Environmental	Oil spill, air pollution, water or soil contamination, environmental discharge
Community impact	Public injury incident, public safety incident

Group	Examples
Asset / property damage	Equipment damage, structural damage, production loss
Others	Specify in your own words

Section 3 — Description

A short one-line summary, the exact location detail, and the **immediate actions** taken, chosen from a checklist such as work activity stopped, area isolated or barricaded, injured person attended, emergency response activated, supervisor notified, hazard controlled, equipment isolated, fire controlled, spill contained, warning signage installed, or no immediate action required. A remarks box follows.

Section 4 — Severity & Risk

- **Impact categories:** People (injury or health), Asset (equipment or property), Environment (spill or pollution) and Community (public or reputation).
- **Severity** (Low to Critical) and **likelihood** (Unlikely to Likely), which combine into the risk meter.
- **Primary consequence**, with options that depend on the impact chosen. For People: first aid, medical treatment, lost time injury, permanent disability or fatality. For Asset: minor or major equipment damage, equipment failure, fire or explosion, production loss. For Environment: contained or major spill, air pollution, water or soil contamination, hazardous release. For Community: public injury, public safety risk, property damage, traffic disruption, reputational impact.

Section 5 — CAPA

Two tables of **corrective actions** and **preventive actions**. Each row has an action, who is responsible, a target date and a status.

Section 6 — Supervisor / Reviewer & Root Cause

Who reviewed it, a target completion date, the action status (Open, In Progress or Closed), a **root-cause type** and a root-cause description. Root-cause types are human factors, equipment or technical failure, procedural or system failure, workplace or environmental conditions, supervision and management, communication failure and organisational factors.

The default target date follows the risk: **Critical 1 day, High 2 days, Medium 7 days, Low 30 days** from the incident date. A custom date can replace it.

3. The High Potential Incident (HPI) Check

An HPI is an event with the potential for a very serious outcome. Section 4 decides this automatically, and a **manual override** lets the reviewer set it to Yes or No by hand.

Rule	Result
Consequence is permanent disability, lost time injury or fatality	HPI
Risk level is High or Critical	HPI
Fire, explosion or major equipment damage, with an asset-cost question	HPI if the cost band is above 100k
Spill, hazardous release or contamination, with release-size and impact questions	HPI if the release is large or spreads outside / risks people
Public injury or public safety risk	HPI if the public safety risk is high
Public property damage	HPI if the cost is above 75 lakh

Follow-up questions appear only when the chosen consequence needs them. Changing the consequence resets them.

4. Submitting and Exporting

1. Pass each section's validation.
2. On the **Review** page, read the summary. A grey banner lists anything missing.
3. Tap **Export PDF** to produce a two-page report: the main details, then the supervisor and root-cause page. Exporting shares the file only and does not save it.
4. Tap **Save & Submit**, confirm, and the incident is stored permanently and the dashboard refreshes. In edit mode the existing record is updated in place.
