Risk meter

HPI check

CAPA tables

1. What It Is

A near miss is an unplanned event that **did not cause harm but had the potential to**. Learning from near misses prevents incidents. The form is amber, the colour of “almost happened”, and follows the shared stepper pattern described in the Report An Event guide.

2. Section by Section

Section	What you enter
1. Reporting details	Location, department, who reported it (or anonymous), date and time
2. Near-miss category	One category from a grouped list, or “Others” with a description
3. Event description	A short summary, the exact location and the immediate actions taken
4. Potential impact & risk	The impact areas that could have been affected, severity, likelihood, primary potential consequence and the risk meter, plus the HPI check
5. CAPA	Corrective and preventive action tables
6. Supervisor / reviewer	Review details, target date, status and a root-cause analysis

3. The Categories

Group	Examples
Physical hazards	Slip / trip, dropped object, struck by or against, caught in or between, work at height
Mechanical & equipment	Moving machinery parts, equipment malfunction, unguarded machine, tool failure, LOTO failure

Group	Examples
Electrical	Exposed live wires, near electric shock, arc flash potential, improper grounding
Chemical / gas	Gas leak, near exposure to a hazardous substance, improper storage
Fire & explosion	Flammable material near an ignition source, gas accumulation, fire-system failure, blocked fire exits
Vehicle & traffic	Near collision, unsafe reversing, pedestrian–vehicle interaction, poor traffic control
Environmental	Oil spill, dust or fume exposure, waste mismanagement, water contamination risk

4. Risk and HPI

- Severity is Low, Medium or High and likelihood is Unlikely, Possible or Likely. The product gives **Low (1–2), Medium (3–4) or High (6–9)**.
- The primary consequence options mirror the incident form but are worded as potentials, such as “Minor injury (FAC)” or “Lost time injury (LTI)”.
- The same **automatic HPI check** as the Incident form applies, with a manual override. A near miss that could have caused a lost-time injury or worse, or that scores High, is flagged as a High Potential event.

The target date for corrective actions follows the risk level, as in the Incident form.

5. After Submitting

The report is added to a permanent near-miss log with the date it was submitted. The Safety Dashboard picks it up straight away, and the report can be opened again from the dashboard’s register in view or edit mode. A PDF copy can be exported at any time.
