

Permit to Work

Digital permits for six kinds of high-risk work, and the form design they all share

6 permit types

5-section form

Gas testing

Composite PDF

1. What a Permit to Work Is

A **Permit to Work (PTW)** is a formal, signed authorisation to carry out a dangerous job. Before work starts, the hazards are identified, the controls are agreed, the area is checked, and the right people sign. DrillTick turns six paper permit forms into digital ones. It is reached from Safety › Process Safety › Permit to Work.

Permit	Tag	Accent colour
Hot Work	Fire / ignition	Red
Cold Work	Mechanical / no ignition	Blue
Confined Space Entry	Atmospheric / enclosed space	Amber
Electrical Isolation	LOTO / electrical safety	Cyan
Working at Height	Fall risk / elevated work	Green
Excavation	Ground risk / earthwork	Purple

The hub lays the six permits out as large tiles in three rows, with an **Export Composite Permit** button underneath. A Radiography permit screen also exists, but it is only a placeholder (see the Electrical, Excavation & Radiography guide).

2. Choosing an Activity

Opening a permit shows a grid of **activities**. Each permit type has its own list, plus a **General** template and an **Others** option that lets the user type a custom activity and its hazards.

Permit	Activities
Hot Work	General Hot Work, Welding / Cutting, Grinding / Spark Work, Open Flame / Heating, Brazing / Soldering, Hot Tapping (high risk), Engine / Generator, Others
Cold Work	General Cold Work, Mechanical Work, Maintenance Work, Manual Tool Work, Cleaning / Housekeeping, Painting / Coating, Inspection / Testing, Electrical Work (isolated), Others
Confined Space	General Controls, Tank / Vessel Entry, Pit / Sump / Underground Chamber, Manhole / Sewer Entry, Pipeline / Duct Entry, Equipment Inspection / Testing, Cleaning Inside, Maintenance Inside, Rescue / Standby Operations, Others
Electrical Isolation	Equipment Isolation, Panel / Switchgear Isolation, Cable / Circuit Isolation, Lockout / Tagout, Testing for Dead, Stored Energy Discharge, Temporary Power Isolation, Maintenance on Isolated Equipment, Energisation / Reinstatement, Others
Working at Height	Ladder Work, Scaffold Work, Work on Platform / Structure, Roof Work, Edge / Open-Side Work, Work Using MEWP, Work on Fragile Surface, Tower / Column Work, Others
Excavation	Manual Excavation, Mechanical Excavation, Trench / Pit / Foundation, Near Underground Utilities, Road / Pavement Cutting, Backfilling / Reinstatement, Others

3. The Five-Section Form

Every active permit uses the same five collapsible cards, so someone who has used one can use all six.

#	Section	What it holds
1	Work description	Location, equipment, description of the work, date, start and end time, number of workers, PTW number and validity
2	Hazard identification & control	A general hazard list and an activity-specific hazard list, each with tick boxes, then general and activity-specific controls . An “Others” group accepts typed items
3	Gas testing / monitoring	A log of readings: location, time, LEL, oxygen, H2S, CO and who tested. A periodic-testing option records how often to retest
4	Hazard analysis checklist	Grouped checks, general ones for the permit type followed by those specific to the activity. Each item cycles through its states with a tap
5	Permit authorisation & closure	Approvals and signatures, then the permit’s life: opened , renewed and closed , each with receiver and issuer name, ID, date and time

Section 3 appears when it is needed

For Confined Space the gas test is always shown and cannot be hidden. For the other permits it appears only when a hazard ticked in Section 2 involves gas, fire or atmosphere. Electrical Isolation replaces it with an isolation register.

4. Saving, Opening and PDF

- **Three slots per activity.** Each permit and activity has its own set of three numbered slots in the app database. For example, a welding permit and a grinding permit never overwrite each other.
- **What a slot stores.** A label and a time, the Section 1 fields, every hazard and control tick, the gas-test rows, the checklist states and every approval and signature field.
- **Opening** refills every section from the chosen slot.
- **Export PDF.** Each permit exports an A4 PDF in the same five-section order, with the gas log and each checklist group as its own table.
- **Older saves.** Permits saved by the earlier file-based system are moved into the database once and the old files are removed.

5. Export Composite Permit

A real job often needs several permits at once. The **composite export** builds one PDF from permits saved in different places.

1. Choose which saved slot to place on each page. Slots can come from any permit type, and also from the **Mobile Crane Lifting Plan** and **Tandem Lifting Plan**.
2. Pages left unassigned become blank placeholder pages.
3. Save the page assignments so the same bundle can be re-opened later.
4. Export. Each page is built exactly as the individual permit's own PDF would be, then the pages are joined into one document.

6. The Shared Design

The six permits share one small set of building blocks: the colour set, the page header with a back button and accent colour, the breadcrumb line, the large tile card and the “coming soon” popup. Each permit adds only its own accent colour and its own lists.

- Dates open a calendar and times open a clock directly under the field.
- Layout adapts to the screen: the checklist sits in a right-hand column on wide screens.
- Because the structure repeats, adding a new permit type mostly means supplying new lists.
