

Confined Space & Working at Height Permits

Entering enclosed spaces, and working where a fall is possible

⚠ FOR UNDERSTANDING PURPOSES ONLY

Confined Space

Always gas-tested

Working at Height

Fall protection

1. Confined Space Entry Permit

A confined space is a space that is enclosed, hard to get out of and not designed for people to stay in, such as a tank, pit or pipeline. The permit is amber, tagged “Atmospheric / Enclosed Space”, and is the most **atmosphere-focused** of the six.

- **Gas testing is always required.** Section 3 is always visible and cannot be dismissed. Readings can be added repeatedly through the entry.
- **Rescue.** A rescue plan and rescue equipment fields appear on every activity, and the authorisation section records the **standby person** and a confirmed rescue briefing.
- **Two extra checklist groups** that the other permits do not have: atmosphere and gas safety, and ventilation control. Together with the general groups, there are ten.

Activities and what makes each one different

Activity	Main hazards	Extra checklist groups
Tank / Vessel Entry	Residual vapour, toxic residue, pyrophoric scale, oxygen depletion	Tank entry safety, residue and scaling control, line isolation
Pit / Sump / Underground Chamber	Groundwater ingress, biological gas, subsidence	Pit entry safety, water ingress control
Manhole / Sewer Entry	H2S, methane, biological contamination, traffic	Sewer entry safety, traffic and surface control
Pipeline / Duct Entry	Pressure blowback, asphyxiation, narrow rescue path	Pipeline isolation, long and narrow rescue system
Equipment Inspection / Testing	Pressurised residues, moving internal parts, test medium	Inspection safety, test pressure and rescue
Cleaning Inside	Chemical splash, degreaser vapour, wet surfaces	Chemical safety, wet-surface control

Activity	Main hazards	Extra checklist groups
Maintenance Inside	Tool vibration, ergonomic strain, sparks from tools	Maintenance tool safety, ergonomic control
Rescue / Standby Operations	Rescuer becoming a victim, breathing-apparatus failure, entanglement	Rescuer safety, breathing-apparatus use, retrieval system

General hazard groups: atmosphere, access and space constraints, energy, work environment, work risks, and exposure and health.

2. Working at Height Permit

Covers any task above about **two metres**, or anywhere a fall could cause injury: ladders, scaffolds, platforms, roofs, edges, mobile elevating work platforms (MEWPs) and towers. The permit is green, tagged “Fall Risk / Elevated Work”.

- **Standby man** field in Section 2, for rescue at height.
- **Fall-protection system group** and a **dropped-object control group** in the checklist.
- **Scaffold inspector** signs the authorisation where a scaffold is involved.
- **Gas testing** is shown only if a gas or atmosphere hazard is flagged, for example work in an elevated confined area.
- Section 1 also records the **height of work** and the platform or access type.

Activities and what makes each one different

Activity	Main hazards	Extra checklist groups
Ladder Work	Tip-over, top instability, overreach, weather slip	Positioning, footing, securing, condition
Scaffold Work	Platform overload, missing guardrail, unsupported boards	Tagging, guardrail, toe board, tie-in
Work on Platform / Structure	Overload, structural failure, anchor failure	Platform structural safety, anchorage verification
Roof Work	Fragile roof, skylights, roof edge	Edge protection, skylight guarding, anchor points
Edge / Open-Side Work	Unguarded edge, wind gusts, trips at the edge	Edge protection, perimeter safety, wind assessment
Work Using MEWP	Tip-over, overhead power lines, crush	Pre-use inspection, operator competency, outrigger deployment
Work on Fragile Surface	Sheet puncture, fibre-cement failure, snow load	Fragile-surface boards, load distribution, signage

Activity	Main hazards	Extra checklist groups
Tower / Column Work	Fatigue, hand-hold failure, tool drops	Harness use, rest platforms, tool tethering

General hazard groups: fall hazards, structural hazards, equipment and work hazards, work environment, and human factors. **Seven general checklist groups:** permit and job control, work-environment safety, access-equipment safety, worker safety, fall-protection system, dropped-object control and emergency readiness.

3. Side by Side

Feature	Confined Space	Working at Height
Accent colour	Amber	Green
Gas testing	Always required	Only if flagged
Special fields	Rescue plan, rescue equipment, standby person	Height of work, standby man, scaffold inspector
Unique checklist groups	Atmosphere / gas safety, ventilation control, entry control	Fall protection, dropped-object control, access equipment
General checklist groups	Ten	Seven
